CONSTRUCTION OPERATIONS & CUSTOMER MANAGEMENT

One clear view of every job.

SiteLedger POC
Product & feature guide

A browser-based proof of concept that brings sales opportunities, customers, project delivery, commercial decisions, sample finance and customer communications into one connected workspace.

FRONTEND-ONLY DEMONSTRATION

11	100%	0
Product workspaces	Fictional demo records	External connections

THE POC AT A GLANCE

Built around the way construction work moves.

SiteLedger demonstrates how a construction company could follow a customer relationship from its first enquiry through estimating, project delivery, payment and handover—without switching between disconnected views.

12
Seeded leads across all sales stages

10
Interconnected customer projects

3
Proposed integrations, all disconnected

Business visibility

An owner can scan active work, delivery risks, open pipeline, follow-ups and receivables on one executive dashboard. KPI values are calculated from shared records rather than separately hard-coded totals.

Connected records

Stable IDs link leads, customers, projects, tasks, quotes, variations, invoices, email conversations, calendar events and activity. Related records can be followed across modules.

Workspace map

01 Overview
Business KPIs, charts, attention list, schedule, receivables and activity.

02 Leads & CRM
Opportunity pipeline, follow-ups, ownership and lead conversion.

03 Customers
Contacts, linked work, sample balances, notes and interactions.

04 Projects
Register and project workspace for progress, risk, schedule and commercials.

05 Schedule & tasks
Agenda/week views, task ownership, priority, due dates and status.

06 Quotes & variations
Quote status and variation approvals with contract-value recalculation.

07 Finance
Sample receivables, bills, ageing, outstanding balances and payment demo.

08 Communications
Outlook-style inbox, follow-up flags, calendar agenda and local drafts.

09 Reports
Pipeline, project, task and illustrative financial charts; CSV export.

10–11 Integrations & settings
Disconnected provider cards, simulated sync history, preferences and reset.

CUSTOMER TO CONSTRUCTION JOB

Keep the hand-offs visible.

CRM and project screens demonstrate the path from enquiry to a live job while retaining the customer, commercial and operational context around each record.

Lead-to-project conversion

1 · Qualify
Confirm contact, email and opportunity value.

›

2 · Convert
Reuse or create a customer record.

›

3 · Create job
Generate a linked planning project.

›

4 · Record outcome
Mark lead won and log activity.

Leads & CRM

- Search and filter by stage, owner, source and follow-up timing.
- Create and edit leads; inspect contact, notes and activity in a detail drawer.
- Convert qualified or won records to a customer/project workflow.
- Prevent repeat conversion by retaining the created project link.

Customer directory

- Search customer/company contacts and filter by relationship status.
- See linked projects, open sample invoices and related email threads.
- Edit the customer record, add local notes and link an existing project.
- Navigate from customer context into project workspaces.

Project workspace

Project tab	What it demonstrates
Overview	Customer and site details, project manager, progress, key dates, health/risk, financial summary and upcoming milestones.
Schedule & Tasks	Linked tasks with owners, due dates, priorities and locally editable statuses.
Financials	Original and revised contract values, approved variations, budget, committed and actual costs, variance and open invoices.
Quotes & Variations	Project-linked commercial records and their current decision states.
Communications	Related mock email conversations and calendar events.
Documents & Activity	Mock document register metadata and a chronological project activity view.

Project stage and project health are separate fields.

Planning, Scheduled, In Progress, On Hold and Completed describe the delivery stage. On Track, At Risk and Delayed communicate health. This distinction supports clear operational reporting.

CONTROL THE COMMERCIAL DETAIL

Make decisions and balances easy to follow.

Quotes, variations, invoices and supplier bills share project/customer links and use reusable calculations so the same figure can be reviewed in multiple screens.

Quotes

Track references, descriptions, customer/project, amount, created/sent/expiry dates, follow-up and status from draft through acceptance or decline. Update statuses locally and open quote details.

Variations

Track requested value, schedule impact, request date and approval. Approved values are summed against the original contract. Changing a variation back to a non-approved state removes it from the revised total.

Revised contract = original contract + approved variation amounts.

The application calculates the approved set from the source records, so each variation is counted once rather than repeatedly added when its status changes.

Finance workspace

Invoices

Search and filter by status, project and customer. Review issue/due dates, amount, paid amount, outstanding balance and payment breakdown. A "mark paid" action updates only the local demo record.

Supplier bills

Switch to bills to review supplier, linked project, dates, amount paid, outstanding balance and status.

Calculation	Rule used in the POC
Open pipeline	Sum estimated lead values, excluding Won and Lost.
Outstanding balance	Maximum of zero and invoice amount less amount paid.
Overdue receivables	Invoice due date is before today and outstanding balance is greater than zero.
Invoice ageing	Current, 1–30, 31–60 and 61+ days overdue; fully paid invoices are excluded.
Budget variance	Actual cost minus budget. A positive value means actual cost exceeds budget.

Finance is illustrative—not accounting.

The Finance page identifies sample data and states Xero is not connected. No invoice is issued, no payment is processed, and no accounting record is changed externally.

FROM DAILY WORK TO BUSINESS INSIGHT

Bring the operational picture together.

The remaining modules show how communications, reporting and future system connections could fit into the same workflow—while making the demo boundary explicit.

Communications

- Search mock conversations and filter by customer, project, unread or follow-up.
- Open message details, mark read/unread and flag/unflag for follow-up.
- Review a calendar agenda of meetings, inspections and site events.
- Compose and save a local draft; the UI confirms that it has not been sent.

Reports & analytics

- Lead count and pipeline value by stage; lead sources and sales outcomes.
- Project status/health, task status and overdue milestones.
- Sample receivables, ageing, bills and budget-versus-actual views.
- Project/date filters recalculate selected charts; CSV export downloads current project data.

Proposed integration touchpoints

Provider	Potential future data categories (subject to vendor capability)	POC status
Buildxact	Construction projects, leads, estimates, scheduling, purchase orders and job-cost information.	DEMO MODE — NOT CONNECTED
Xero	Contacts, invoices, bills, payment information and selected accounting summaries.	DEMO MODE — NOT CONNECTED
Outlook	Email conversations, calendar events, customer communication history and follow-up workflows.	DEMO MODE — NOT CONNECTED

Simulate sync is deliberately local.

A click changes the displayed simulated-sync timestamp and adds a row to mock sync history, including the sample warning. It does not connect to a provider, fetch records, or change the disconnected state.

Settings

Configure company/user display names, currency and demo notification preference. Currency formatting is shared throughout the application. Reset restores the seed records while preserving workspace preferences.

Global search

Search leads, customers, projects, invoices and quotes from the top bar. Results show record type and a secondary description; selecting a result opens its module. Ctrl/⌘+K focuses search.

HOW TO EVALUATE THE DEMONSTRATION

Explore safely. Learn what to build next.

The POC is designed for stakeholder walkthroughs and workflow feedback. It demonstrates front-end behavior only and should not be used to manage live construction, customer or accounting data.

Local data behavior

Seed records initialize on first use. Changes persist in browser local storage for that browser/profile. Records are fictional. Reset restores seeded records, and invalid saved JSON falls back to fresh seed data.

Run the application

Install Node.js 18 or later, then run **npm install** and **npm run dev** from the project folder. Create a production build with **npm run build**.

Core workflows verified in the running UI

- ✓ **Lead conversion**
  Created a qualified lead, converted it to a customer/project and landed on its detail page.
- ✓ **Variation approval**
  Approved variation changed the project's calculated revised contract value; resetting restored seed data.
- ✓ **Local payment simulation**
  Marked a sample invoice paid; balance/status and finance KPIs recalculated.
- ✓ **Integration simulation**
  Added simulated sync history and kept the provider disconnected.
- ✓ **Report download**
  CSV export downloaded project report rows using browser-generated data.
- ✓ **Routes and responsive check**
  All listed routes rendered; dashboard was checked at a 390px viewport.

Scope boundaries

- No backend, API server or database.
- No live Buildxact, Xero or Microsoft Graph connections.
- No document upload/storage; register is metadata only.
- Financial, customer and operational records are fictional.
- No authentication or authorization.
- No email sending, invoice issuing or payment processing.
- No cross-device synchronization or shared users.
- Light theme only; other selected theme values are preferences only.

Recommended next step: validate the workflow before integrating.

Use stakeholder sessions to confirm ownership, status definitions, approval rules, reporting needs and the authoritative system for each data domain.

1 · Product discovery

Confirm personas, permissions, field requirements and exception paths.

2 · Data & security

Design backend, audit, access control, privacy and retention before real data.

3 · Integration design

Validate vendor APIs, system-of-record ownership, reconciliation and failure handling.
